### 'The Value of Crimestoppers'

A Research Study Conducted for the Crimestoppers Trust

By

Alan Marlow & Ralph Miller Vauxhall Centre for the Study of Crime University of Luton December 1999

### THE VALUE OF 'CRIMESTOPPERS'

By

Alan Marlow & Ralph Miller Vauxhall Centre for the Study of Crime University of Luton

### Foreword

3

The authors of the report would like to extend their sincere thanks to all the police officers, police civilian staff and members of the Crimestoppers Trusts who helped and supported this research. Their generosity in providing time and hospitality is very much appreciated. The burden of yet another form to complete is never welcome and we are most grateful to the many that did so.

### THE VALUE OF CRIMESTOPPERS

### **SUMMARY**

### 1. Introduction

H

3

1

-

11

III (

The principle of Crimestoppers is that it uses guaranteed anonymity as a means of increasing usable information on crime and offenders to assist or increase apprehensions, convictions, the recovery of property or the seizure of illegal items or substances. The Crimestoppers Trust is a registered charity that manages the non-police aspects of the scheme — publicity, promotion, financial rewards—and fundraising. There are 29 regions, in each of which is a Crimestoppers Office funded and staffed by the constituent police forces. Each region is supported by a Board of Volunteers drawn from the local business community, media, local authorities and the police. The local boards work under the umbrella of the Crimestoppers Trust.

### 2. The Research

The remit was to seek to establish the value of Crimestoppers to the Police and Society in general. Measures were derived to give indication of 'added value':-

- crimes that would not otherwise have come to notice are revealed and detected due to Crimestoppers information
- crimes may have been reported but would not have been detected without information from Crimestoppers
- information from Crimestoppers assisted in the detection of crime or crimes
- new offenders were revealed by information from Crimestoppers
- known offenders were convicted of new offences as a result of Crimestoppers
- offenders regarded as 'serious' were apprehended as a result of Crimestoppers

The aim of the research was to establish whether or not Crimestoppers 'added value' within the terms of the above measures.

### 3. Methodology

The information sought for this research was known to case officers and it is to them that the research instrument was administered. Only cases with successful outcomes to which Crimestoppers contributed were the subject of the analysis. The distribution and collation of questionnaires was managed by regional co-ordinators who

E

Ī

1

E

volunteered to participate in the research. 10 of the 29 regions participated. The selected regions provided a mix of characteristics - metropolitan, urban and rural. Successful outcomes generated a questionnaire to the case officer, who was requested to complete the document and return it to the co-ordinator. Confidentiality was not compromised as statistical outcomes only were required and offenders were not identified. The period selected was the months of February and March 1999.

### 4. The Sample

The proportion of returns received compared to the maximum that could be expected was 63.5%. Using the total arrest and charge data obtained from the Crimestoppers Trust for 1998, the sample amounts to 6.7% of annual returns. The pattern of offences in the sample closely matched the pattern of offences contained within the Crimestoppers Trust data (Appendix A).

### 5. The Offences Revealed

The data shows that the highest proportion of offences revealed by Crimestoppers related to the misuse of drugs (44%) and vehicle crime the next highest category (12.4%).

### 6. Value of Property Recovered

Respondents were requested to indicate the value of property recovered. In only 174 of the 345 cases was this category of information completed. Nevertheless, the information does give some indication of a 'cash value' to Crimestoppers information. The total value indicated amounted to £1,464,978. This figure is skewed by the recovery of £750,000 in drugs and proceeds in one case. Most recoveries tend to be relatively low in value. Of the recoveries over £10,000, 4 of the 7 cases related to the recovery of vehicles. The two 'big hits' related to drug seizures of £750,000 and £300,000.

### 7. The Value of the Information from Crimestoppers

41% of the crimes in the sample would not have come to notice without the information from Crimestoppers. There is good reason to believe that this is an under-representation of the true figure. In 94% of the cases, the information was useful or critical. In only 4 instances (1%) was the information of no value due to its anonymity. 14 informants were recruited as a result of information to Crimestoppers.

### 8. Cases of Particular Note

This research was intended to be quantitative but there are returns for particular cases that provide illustration of the quality of some of the information revealed through Crimestoppers. These cases include three murders and brief details are included in the text of the report.

### 9. Offenders Revealed by Crimestoppers

In 63% of the cases, previously unknown or known offenders who were not suspected were arrested and charged with offences. In the remaining 37% of cases information from Crimestoppers contributed to the arrest and charging of offenders who were known and suspected of the offences revealed. 5.5% were known and regarded as serious offenders (individuals whose criminal history indicates significant involvement in serious crime). 11% had been identified as 'target' criminals (individuals whom the police have evidence to indicate routine involvement in offending and who have been selected by the police as priority targets for arrest). The proportion of new offenders, at 30%, tends to be higher in the non-drug offence categories. However, three quarters of the 'target' criminals were in the drug offence category.

### 10. Police Officers Valuation of Crimestoppers

Police officers completing the questionnaires were asked to indicate their own evaluation of Crimestoppers as means of detecting crime. 74% of the respondents indicated valuations in the top two of the seven rating categories and 87% of the scores were above the mean.

### 11. Conclusions

In all of the indicators of 'added value' selected for this research, positive outcomes were evident and the hypothesis that Crimestoppers adds value to the police and the public in terms of crime control strategies is clearly confirmed. To this should be added that fact that Crimestoppers is highly regarded as a technique for crime investigation by at least 74% of practitioners.

A number of studies of the process by which crimes are cleared all emphasise that the prime determinant is information provided by members of the public and that a much smaller proportion are cleared up by other investigative techniques. A corollary of those conclusions is that an initiative which increases public participation in the process of crime investigation is likely to have a greater effect on clear-up rates than other measures. Crimestoppers does this through the notion of 'anonymous justice' by providing the public with an outlet for information that does not include the 'costs' of becoming involved in the criminal justice system.

In the case of the best provided region, each member of the Crimestoppers office is, according to this research, responsible for the apprehension of 103 offenders who were either previously unknown to the police or who were linked to offences of which they were not previously suspected.

### THE VALUE OF CRIMESTOPPERS

### 1. Introduction

3

=

The principle of Crimestoppers is that it uses guaranteed anonymity as a means of increasing usable information on crime and offenders to assist or increase apprehensions, convictions, the recovery of property or the seizure of illegal items or substances. It is a tactic available for use in strategies of crime control. The concept originated in the United States in 1976 and was introduced to the United Kingdom in 1988. Since then, the volume of calls to Crimestoppers has increased yearly and the number of persons arrested and charged annually has increased by almost a factor of 10 (Appendix A).

The shift towards intelligence led detection in policing, signalled by the Audit Commission's 'Helping With Enquiries: Tackling Crime Effectively' (Audit Commission 1993) has given impetus to Crimestoppers.

The Crimestoppers Trust is a registered charity that manages the non-police aspects of the scheme – publicity, promotion, financial rewards and fundraising.

There are 29 regions, in each of which is a Crimestoppers Office funded and staffed by the constituent police forces. Each region is supported by a Board of Volunteers drawn from the local business community, media, local authorities and the police. The local boards work under the umbrella of the Crimestoppers Trust.

### 2. The Research

This research was commissioned by the Director of the Crimestoppers Trust, Digby Carter MBE. The remit was to seek to establish the value of Crimestoppers to the Police and Society in general.

In a paper presented at the Police Staff College in November 1995, G.D.Berry of Staffordshire University used the concept of opportunity cost to assess the effect of Crimestoppers (Berry 1995). Despite the fact that available data precluded an accurate resource saving analysis, the model derived suggested that the use of Crimestoppers could produce gross savings of at least £4.6 million per annum, representing 70 additional police officers available for duty.

Some preliminary enquiries were conducted at Crimestopper regions, as a result of which it was concluded that any approach based upon a simple cost-benefit analysis may not be achievable as there are too many intervening

variables to try to demonstrate a simple cause and effect sequence. In any case, such a study was beyond the resources of this research. The aim of the research was therefore to seek to demonstrate the concept of 'added value', or to reverse the premise, what would be lost if Crimestoppers was not available.

### Value to the Public

It may be posited that Crimestoppers adds public value by increasing the concept of harm reduction through retributive justice. Anonymity reduces the costs to the citizen in the sense that s/he is not inconvenienced, discomforted or 'put at risk' by identified involvement in the criminal justice process. The notion of 'fairness' will be enhanced as more offenders are convicted of crime that result in harm, property is recovered and illegal gains forfeited. There is also an added deterrent effect if the costs of committing crime are raised through an increased chance of discovery. This will be enhanced if 'serious', career or persistent offenders are revealed and convicted. A logical consequence of increased deterrence is the possibility of a reduction in the volume of crime.

### Value to the Police

If it is assumed that people are deterred from informing on crimes and offenders by having to identify themselves to the criminal justice process, guaranteed anonymity should increase the willingness to call and therefore the police's knowledge of crime and criminals. The information may add significantly to what is already known or it may be completely new. The Audit Commission's 'Helping With Enquiries' advocated targeting as a technique to apprehend criminals and therefore Crimestoppers should 'fit' with this approach. Information from Crimestoppers sources should result in an increased number of detected crimes and the apprehension of offenders who may otherwise not have come to notice. Thus, it will contribute to a Force's overall performance in the detection of crime.

### Indicators of Value

From the foregoing discussion, some measures may be derived that will give indication of 'added value':-

- crimes that would not otherwise have come to notice are revealed and detected due to Crimestoppers information
- crimes may have been reported but would not have been detected without information from Crimestoppers
- information from Crimestoppers assisted in the detection of crime or crimes

- new offenders were revealed by information from Crimestoppers
- known offenders were convicted of new offences as a result of Crimestoppers
- offenders regarded as 'serious' were apprehended as a result of Crimestoppers

The aim of the research was to establish whether or not Crimestoppers 'added value' within the terms of the above measures.

### 3. Methodology

3

3

3

3

3

可

ョ

Some preliminary interviews were conducted with staff associated with Crimestoppers at two large regions, the London and West Yorkshire (the latter serves six police force areas). These allowed the formulation of some conclusions concerning key elements of the process:-

- 1. Between 5 & 10% of all calls are actionable and the quality of this percentage can be remarkable. The skills of the call receiver are therefore critical in assessing the quality of information
- 2. Callers generally fall into three categories, criminals, their close associates and, by far the majority, ordinary members of the public who are worried or bothered. Rewards are a minor consideration for most callers
- 3. Usable information is received on individuals who would otherwise be unknown to police intelligence systems
- 4. One of the biggest problems in assessing the effectiveness of the scheme is the difficulty of obtaining results. Co-ordinators estimate that only about 75% of successful outcomes are identified. Case officers, burdened with more critical paperwork, often overlook the notification of a positive result.

The information sought for this research was known to case officers and it is to them that the research instrument was administered. Only cases with successful outcomes to which Crimestoppers contributed would be the subject of the analysis. The returns that identify such cases do not form a complete record of successful outcomes but they do at least provide a starting point where it is known there was such a contribution. Case officers conscientious enough to complete a return form were assumed to be equally likely to complete a simple questionnaire. In an attempt to overcome the reluctance to return paperwork viewed as unnecessary, the questionnaire was devised in a simple a form as possible. Detail was sacrificed in order to obtain a representative volume of returns.

The distribution and collation of questionnaires was managed by regional coordinators who volunteered to participate in the research. regions participated. The selected regions provided a mix of characteristics -Details of the participating regions are metropolitan, urban and rural. Returns on successful outcomes generated a shown in Appendix B. questionnaire to the case officer, who was requested to complete the second page and return it to the co-ordinator. Confidentiality was not compromised as statistical outcomes only were required and offenders were not identified. The period selected was the months of February and March 1999. Crimestoppers statistics to estimate of the number returns expected for the two month period for the participating regions, the volume of responses should number about 500, equivalent to 10% of total successful outcomes, measured in terms of offenders arrested and charged, recorded in 1998 (Appendix A).

Each of the Regions was visited or in two cases, were the subject of telephone briefings on the principles and management of the project. The opportunity was taken to conduct interviews with co-ordinators and staff and a summary of the conclusions from the interviews is included in this report.

### 4. The Sample

Using the Crimestoppers data for 1998 for 'arrested and charged' outcomes (Appendix A), it was possible to calculate, by averaging the monthly volumes for the participating regions, the number of returns that might be expected if a total sample was to be achieved. The actual number of returns received could thus be compared to establish the extent and quality of the sample. The following table compares the expected volume of questionnaires received with the actual number received for the two-month study period:-

Table 1 Sample Comparison With Expected Levels

Tuble 1 Sumple C			Control of the Contro
Region	Expected	Received	Variation
A	27	18	-9
В	13	9	-4
С	111	78	-33
D	10	4	-6
E	17	41	+24
F	105	24	-81
G	71	45	-26
H	60	8	-52
I	32	18	-14
K	97	100	+3
Totals	543	345	<i>-</i> 198

The proportion of returns received compared to the expected level was 63.5%. Using the total arrest and charge data for 1998, the sample amounts to 6.7% of annual returns.

1

H

I

1

3

1

3

3

100

A similar calculation was conducted in relation to the offences revealed in the sample by comparing the proportions of offences expected from 1998 Crimestoppers data with the proportions within the sample. The comparison is shown graphically:-

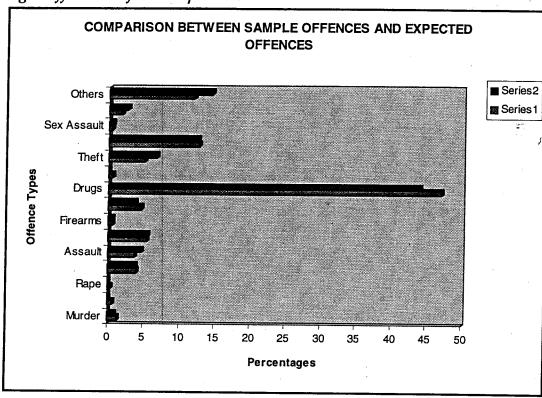

Fig 1 Offence Profile Comparison

Series 1 are the offences revealed in the survey and Series 2 represents the proportions of offences expected. There is a close match between the offences between the two profiles. In other words, the sample was representative of the annual data provided to the Crimestoppers Trust (Appendix A) in terms of the types of offences revealed.

### 5. The Offences Revealed

The survey showed the following offence profile:-

Table 2 Offences

CRIME TYPE	NUMBER	PERCENTAGE
Murder	3	0.9
Att Murder	0	0
Rape	0	0
Robbery	13	3.7
Assault	16	4.6
Burglary	19	5.5
Firearms	2	0.6
Handling	13	3.7
Drugs	152	44.0
Arson	0	0
Theft	23	6.7
Vehicle Crime	43	12.4
Sexual Assault	2	0.6
Fraud	9	2.6
Other	50	14.5
Totals	345	100

The data shows that the highest proportion of offences revealed by Crimestoppers are related to the misuse of drugs. The 'other' category will typically include traffic offences such as drink driving, contraband and other matters that do not fall within the Home Office classification of crimes.

### 6. Value of Property Recovered

Respondents were requested to indicate the value of property recovered. In only 174 of the 345 cases was this category of information completed. Nevertheless, the information does give some indication of a 'cash value' to Crimestoppers information. The total value indicated amounted to £1,464,978. This figure is skewed by the recovery of £750,000 in drugs and proceeds in one case.

The average recovery value for those cases where it was indicated was £8419, using all cases as the divisor, the average amount becomes £4246. This compares with a case average of £2128 for the annual Crimestoppers data for 1998 (Appendix A). Again, the high figure distorts the average. Most recoveries tend to be relatively low in value.

Table 3 Value of Recovered Items

Value of Recovered Items	Percentage (1	1 = 174)
£1000 or less	76%	
£1001 to £10000	20%	
Over £10000	4%	

Of the recoveries over £10,000, 4 of the 7 cases related to the recovery of vehicles. The two 'big hits' related to drug seizures of £750,000 and £300,000.

### 7. The Value of the Information from Crimestoppers

Case officers were asked to indicate the value of the information received via Crimestoppers to the detection of the case. They were asked to consider which of the following applied:-

- 1. the crime(s) would not have come to notice without it
- 2. the crime(s) would not have been detected without it
- 3. the crime was reported but the information was crucial to detection
- 4. the information was useful but not critical
- 5. the information was of little or no value
- 6. the information was of little or no value due to anonymity
- 7. an informant was recruited

T

1

₹

₹

1

There was some variation in the responses, for example some officers would double score and others single score e.g. some would score for both categories 1 & 2 whereas others would score 1 only, when, by implication, 2 would also apply. These scores should therefore be regarded as separate categories and should not be added together. The percentage of responses in each category is shown in the following tables:-

Table 4 Crimes Identified Solely as a Result of Crimestonners

C: ()	
Crime (s) would not have come to notice without Crimestoppers	11%
	1 47/0

There is good reason to believe that the 'crime would not have come to notice' category is a significant under-representation of the true figure. In only 52% of the misuse of drugs cases was the category 'crime would not have come to notice without the information' indicated. This seems illogical for a victimless crime, particularly where the offences were predominantly small scale and almost all resulted from one region. Assuming this to be an erroneous interpretation, then the number of new offences revealed by Crimestoppers should be in the region of 60%.

Table 5 Value of Information

Crime(s) would not have been detected without it	40%
Crime was reported but the information was crucial to detection	23%
Information was useful but not critical	27%
Information was of little or no value	5%
Information was of little or no value due to anonymity	1%
Total	96%
Informant Recruited	4%
	1 - /0

In 94% of the cases, the information was useful or critical. In only 4 instances (1%) was the information of no value due to its anonymity. It should, however, be borne in mind that this is a survey of successful cases and the latter factor may feature to a much greater extent in information not pursued.

Particularly interesting is the fact that 14 informants were recruited as a result of information to Crimestoppers. Whether these were potential offenders or witnesses is not stated, but it does indicate that Crimestoppers contributes to information led detection by this powerful means. These findings can be shown graphically as follows:-

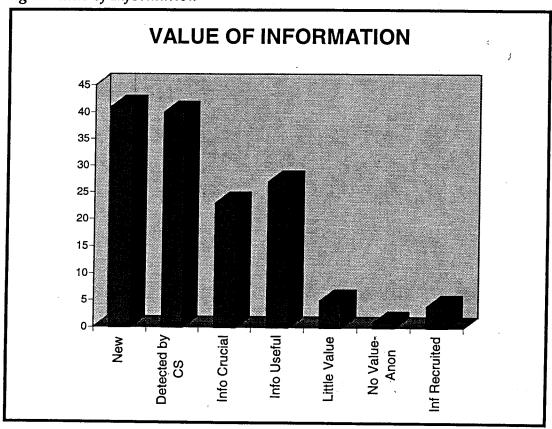

Fig 2 Value of Information

### 8. Cases of Particular Note

This research was intended to be quantitative but there are returns for particular cases that provide illustration of the quality of some of the information revealed through Crimestoppers.

A Drug Related Murder in Strathclyde The information received from Crimestoppers contributed to the conviction of an individual who was known and suspected of the offence and who had been identified as a target criminal.

A Murder in Greater Manchester The crime would not have come to notice without Crimestoppers and the information was crucial to its detection.

च

1

1

3

1

च

I

3

A Murder in Strathclyde The crime had been reported but the information was crucial to the detection of a known and suspected offender

A Drugs Case in West Yorkshire Drugs and other property to the value of £750,000 was recovered. The offence would not have come to notice had it not have been for information to Crimestoppers. The offender was known but not suspected of this offence.

Drug Offences in South Yorkshire the Officer in the Case had written on the questionnaire that without the information from Crimestoppers he would have been totally unprepared for other information confirming the offence. The source was invaluable for the apprehension of an offender who was not previously known. Drugs to the value of £300,000 were recovered.

Drug Offences in Lothian & Borders The crimes would not have come to notice without the information from Crimestoppers. £2200 worth of drugs and £4000 in cash were confiscated.

Handling Stolen Goods in Metropolitan Police Area £150,000 mobile telephones were recovered. The information to Crimestoppers was crucial to the arrest and charge of an offender who was known and suspected of the offence.

A Burglary in the Metropolitan Police Area In excess of £10,000 in property was recovered and the offence would not have been reported had it not have been for information to Crimestoppers. A known offender was arrested.

### 9. Offenders Revealed by Crimestoppers

Respondents were asked to indicate the quality of the information in respect of the offender(s) revealed by Crimestoppers. The categories they were requested to indicate were whether new offenders were revealed or whether new information was gained on offenders with a criminal history or suspected of criminal activity. They were also asked to indicate whether or not offenders could be classed as a 'serious offender' and whether or not they had been identified as a 'target' for intelligence led policing tactics.

Table 6 Offenders Revealed

	Number	Percent
Not previously known	76	22
Known but not suspected of this offence	142	41
Known & Suspected of this offence	129	37
Total	347	100
Known & regarded as a serious offender	19	5.5
Had been identified as a target criminal	37	11

The data indicates that in 63% of the cases, previously unknown or known offenders who were not suspected were arrested and charged with offences. In the remaining 37% of cases information from Crimestoppers contributed to the arrest and charging of offenders who were known and suspected of the offences revealed. 5.5% were known and regarded as serious offenders (individuals whose criminal history indicates significant involvement in serious crime). 11% had been identified as 'target' criminals (individuals whom the police have evidence to indicate routine involvement in offending and who have been selected by the police as priority targets for arrest).

It is a logical hypothesis, bearing in mind the widespread use of drugs and the 'victimless' nature of the offence, that drug cases would reveal more 'unknown' offenders. In fact the reverse was the case. In only 18 (12%) of the 152 drug cases were new offenders revealed - information tended to relate to already known offenders in this offence category. The proportion of new offenders, at 30%, tends to be higher in the other non-drug offence categories. However, three quarters of the 'target' criminals were in the drug offence category. This data can be represented graphically as follows:-

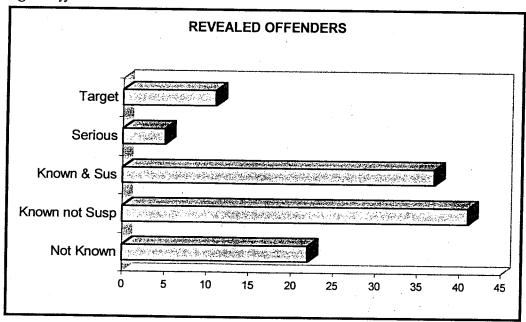

Fig 3 Offenders Revealed

### 10. Officers Valuation of Crimestoppers

In the final question, officers were asked to indicate their own evaluation of Crimestoppers as means of detecting crime. They were asked to ring a figure on a scale of 1 (extremely valuable) to 7 (of no value). The frequency of the scores is shown in the following table:-

I

J

10

1

1

1

1

1

₹

1

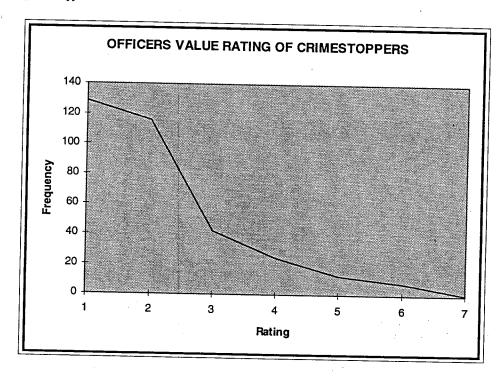

1

Table 7 Police Officers' Valuation

SC	ORE		FRE	EQUENC	ΞY

7	Of	no	1	(0.3%)	
val					
TO	TAL		334		

74% of the respondents indicated valuations in the top two categories and 87% of the scores were above the mean. The information can be represented graphically as follows:-

Fig. 4 Officers Valuation

### 11. Conclusions

This has been a simple evaluation. It was not intended to be sophisticated as over elaboration of the research instrument would not have encouraged its submission. The questions it posed were quite simple and intended to provide a broad indication of the value of the concept of Crimestoppers. The findings are summarised by using the indicators of 'added value':-

Crimes that would not have come to notice are revealed and detected

41% of the sample related to offences that brought to notice solely as the result of information received from Crimestoppers. There is good reason to argue that this is a significant under-representation and that the true figure should be in the region of 60%. The most prevalent offence category was related to the misuse of drugs and there were two high value cases revealed. The government's anti-drugs strategy has created performance targets for the police (Home Office Circular November 1998) and Crimestoppers would appear to be a particularly good source of information for constructing intelligence in this offence category.

Crimes may have been reported but would not have been detected without information from Crimestoppers

The responses indicate that 40% of the revealed offences are detected solely as a result of information received by Crimestoppers.

Information from Crimestoppers assisted in the detection of crime or crimes

In addition to the 40% of offences detected solely as a result of Crimestoppers calls, in a further 23% the information was regarded as a crucial element in detection and in 27% of cases it was useful but not critical. In all but 6% of the offences in the sample, the information was crucial or useful. The anonymity of callers was not shown to be a significant impediment but may be so in filtering cases worthy investigation. 4% of the responses indicated that informants were recruited as a result of the information.

New offenders were revealed by information from Crimestoppers

The survey responses related to the apprehension of 347 offenders, 76 or 22% of whom were not previously known to police records. The proportion of 'new offenders' tends to be higher in non-drug offences (30% compared with 12% for drug offences).

Known offenders were convicted of new offences as a result of Crimestoppers

The results indicated that in 41% of the cases, previously 'known' offenders were arrested for offences in which the only information to connect them to the crimes was that emanating from Crimestoppers. In a further 37% of cases the information was a contributory factor in the arrest and charging of offenders already known and suspected of the offence.

1

7

T

3

I

1

3

च

1

1

3

国

1

1

1

Offenders regarded as 'serious' were apprehended as a result of Crimestoppers

The respondents indicated that 5.5% of the offenders were known and regarded by case officers as 'serious' and 11% of the total had been identified as 'target' criminals.

In all of the indicators of 'added value' selected for this research, positive outcomes are evident and the hypothesis that Crimestoppers adds value to the police and the public in terms of crime control strategies is clearly confirmed. To this should be added that fact that Crimestoppers is highly regarded as a technique for crime investigation by at least 74% of practitioners.

A number of studies of the process by which crimes are cleared all emphasise that the prime determinant is information provided by members of the public and that a much smaller proportion are cleared up by other investigative techniques (Reiner 1992). A corollary of these conclusions is that an initiative which increases public participation in the process of crime investigation is likely to have a greater effect on clear-up rates than other measures.. Crimestoppers does this through the notion of 'anonymous justice' or providing the public with an outlet for information that does not include the 'costs' of becoming involved in the criminal justice system.

Using information from Crimestoppers effectively is not cheap. It requires dedicated staff, managerial impetus and investment in skills as well as hardware. However, in the case of best provided region, each member of the Crimestoppers office is, according to this research and Crimestoppers data (Appendix A) responsible for the apprehension of 103 offenders who are either previously unknown to the police or who are linked to offences of which they were not previously suspected. It is a level of productivity likely to be the envy of other officers.

### APPENDIX C

### OPERATING THE POLICE SIDE OF 'CRIMESTOPPERS'

The researchers visited 8 out of the 10 regional co-ordinators during the course of the research, held discussions with them and viewed the operation of their system. As a result, the following observations are made.

### **Operating the System**

Arrangements for the receipt and assessment of calls varied considerably. The optimum provision is found at the London Region where caller interrogation is conducted by trained detective officers, whereas in one county force calls to Crimestoppers are dealt with as part of the normal call handling system. The dissemination of information is similarly varied. All co-ordinators are agreed that the key to an effective use of the system is the production of actionable packages through a careful interrogation of callers. 90% of the calls tend to be of no actionable value and there are many annoying hoax calls, particularly during the school holidays. The quality of the remaining 5 - 10% of calls can be extremely high, provided they are properly 'filtered' from the rest.

The interrogation skills can be acquired by civilian members of staff and examples were found where experienced civilian staff undertake the function. Some regions will only action calls relating to recordable crimes where there is a statutory power of arrest, whilst others have no such limitation and will take calls relating to road traffic matters or other illegal activity. In one case of illegal importation, £1.5 million pounds of goods were confiscated following information to Crimestoppers.

The co-ordinators with the most difficult roles were those servicing a number of police forces whose responses tend to vary according to their differing perceptions of the value of information produced by Crimestoppers.

### Callers

There was a consensus amongst co-ordinators that callers tend to fall into three categories:-

- criminals
- close associates
- ordinary citizens who are concerned or bothered by some activity

The first two categories are small but provide the best quality information. For some callers, Crimestoppers is often the last resort and if they terminate a call, they will often ring back. Rewards tend to be a minor incentive but nevertheless a valuable one.

### Relationships with the Crimestoppers Boards

The interviews revealed close and reciprocal relations between the Crimestoppers Boards and the Co-ordinators. In the centres observed, the joint sense of purpose was clear and unequivocal. As a general rule, the less resourced the co-ordinator, the more the efforts of the Board were valued. The involvement of influential members of the public is seen as an effective means of citizen involvement in crime reduction. As one co-ordinator put it "We have a common agenda - keeping criminals of the street and spreading best practice to achieve that."

### **Giving Clout to Crimestoppers**

The observations, research activity and the results lead to two unavoidable conclusions. The two variables that determine the effectiveness of a Crimestoppers operation are the willingness of police management in giving impetus to it and the energy and drive of the co-ordinators. The degree of managerial commitment tended to 'shine through' in the interviews conducted.

### VAUXHALL CENTRE FOR THE STUDY OF CRIME, UNIVERSITY OF LUTON

### **EVALUATION OF CRIMESTOPPERS**

The Vauxhall Centre for the Study of Crime at the University of Luton has been commissioned by the Crimestoppers Trust to research the value of Crimestoppers to the Police and society. As part of the project a survey is being conducted seeking the views of officers who act on the information received from the public. It is appreciated that you are already burdened with paperwork but it will be extremely helpful if you could spare a moment or two to complete Part 2 of this simple questionnaire. It relates to a case with which you dealt and where information from Crimestoppers was acted upon. This data will be treated with complete confidence. The result will be a statistical analysis.

PART	1 OFFENC	E DETAILS				
1.	Force:	••••••	•••••			,
2.	Date of offences					
3.	Ref No:			***************************************	•	
4.	Crime Type (Pl	ease tick):				
1 1 ( ]		6.Burglary		11.The		
1.Murd		7.Firearms			n Crime	
2.Att M	urder	8.Handling			Assault	
3.Rape		9.Drugs		14.Fra	ud	
4.Robbe 5.Assau	ery	10.Arson		15.Oth	ner	
5.	Property Recov			4.Contraba	and $\Box$	
	2.Drugs			5.Other		
	3.Firearms			. ·	•

6.	Personal Injur	y (Please tick	if appropri	ate):		
1.Fat	tal [	<b></b>	2.Serious		3.Slight	

3

### PART 2 FOR COMPLETION BY OFFICER IN CASE

7. How useful was the information received from 'Crimestoppers' (Please tick those statements that apply)

1. Crime(s) would not have been	
brought to notice without it	
2. Crime(s) would not have been	,
detected without if	
2. Crimo was reported but	
information was crucial to detection	
4. Information was useful but not	
critical	
5. A registered informant was	<b>4</b> 7
recruited as a result	,
6. Information was of little or no	
value	
7. Information was of little or no	
value due to anonymity	

8. The Offender(s) (Please tick those statements that apply)

1. Not previously known	
2. Known but not suspected of this	
offence 3. Known and suspected of this	
offence	
4. Known and regarded as 'serious' offender(s)	
5. Had been identified as a target	
criminal	, ,

9. How do you value the 'Crimestoppers' concept as means of detecting crime? (Please ring a figure according to how strongly or otherwise you value the concept)

Extremely	Valuable				Of no	o value
1	2	3	4	5	6	7

Thank you for your time. It is very much appreciated.
